

IN THE CLAIMS

Please amend the claims as follows:

1. (Previously Presented) An implantable dual-chamber defibrillation or cardioversion device, comprising:
at least first and second input leads for sensing atrial and ventricular electrical signals from a heart;
a therapy circuit for delivering electrical energy through one or more of the leads; and
a monitoring circuit for monitoring the electrical signals through one or more of the leads, the monitoring circuit comprising:
a programmable memory device for storing one or more cross-chamber blanking settings; and
circuitry for blanking an effect of atrial electrical signals in the monitoring circuitry for a period of time based on at least one of the cross-chamber blanking settings.
2. (Currently Amended) A dual-chamber defibrillation or cardioversion system comprising:
a dual-chamber defibrillator or cardioverter including first and second leads for sensing signals from respective first and second chambers of a heart and a monitoring circuit for monitoring signals sensed at the first and second leads, the monitoring circuit having:
a memory circuit for storing one or more cross-chamber-blanking settings;
and
a cross-chamber-blanking module ~~responsive to one of the settings~~ for disabling sensing signals at either the first or second lead for a preset time period based on at least one of the cross-chamber-blanking settings; and
means for changing one or more of the ~~cross-chamber-blanking~~ cross-chamber-blanking settings after implantation of the defibrillator or cardioverter.

- 3-5. (Canceled)
6. (Currently Amended) The device of claim 1, wherein the circuitry for blanking includes means for computing a noise window width based on a refractory period and one of the ~~cross-chamber blanking~~ cross-chamber-blanking settings.
7. (Currently Amended) The system of claim 2, wherein the ~~cross-chamber blanking~~ cross-chamber-blanking module includes means for computing a noise window width based on at least the one of the ~~cross-chamber blanking~~ cross-chamber-blanking settings.
8. (Currently Amended) An implantable dual-chamber cardioversion or defibrillation device, comprising:
first and second leads for sensing signals from respective first and second chambers of a heart;
a monitoring module for monitoring signals sensed at the first and second leads, the monitoring means including:
a memory module for storing one or more cross-chamber-blanking settings; and
a cross-chamber-blanking module responsive to at least one of the settings for disabling sensing signals at the first or second lead or for ignoring signals at the first or second lead for a time period based on at least one of the stored cross-chamber blanking settings;
means, coupled to the memory module, for wirelessly receiving at least one cross-chamber blanking settings after implantation of the device and for programming the memory module based on the one received cross-chamber blanking setting;
and
a therapy module, responsive to the monitoring module, for delivering a therapeutic agent to the heart.
9. (Currently Amended) The device of ~~claim 7~~ claim 8, wherein the therapeutic agent is a non-electrical agent.

-
10. (Previously Presented) The device of claim 7, wherein the cross-chamber-blanking module comprises means for computing a noise window duration based at least on the one cross-chamber blanking setting.
11. (New) A dual-chamber defibrillation or cardioversion system comprising:
a dual-chamber defibrillator including first and second leads for receiving signals from respective first and second chambers of a heart and a monitoring circuit for monitoring signals sensed at the first and second leads, the monitoring circuit having:
- a memory circuit for storing one or more cross-chamber-blanking settings;
 - and
 - a cross-chamber-blanking module for disabling sensing signals at either the first or second lead for a preset time period based on at least one of the cross-chamber-blanking settings; and
- a programmer for changing one or more of the cross-chamber-blanking settings after implantation of the dual-chamber defibrillator.
12. (New) The system of claim 11, wherein the programmer comprises means for changing one or more of the cross-chamber-blanking settings after implantation of the defibrillator or cardioverter.
13. (New) The system of claim 11, wherein each of the first and second leads comprise means for receiving signals from first and second chambers of the heart.
14. (New) The system of claim 11, wherein the memory circuit comprises means for storing one or more cross-chamber-blanking settings.

15. (New) The system of claim 11, wherein the cross-chamber-blanking module comprises means for disabling sensing signals at either the first or second lead for a preset time period based on at least one of the cross-chamber-blanking settings.
16. (New) The system of claim 11, wherein the cross-chamber-blanking module includes means for computing a noise window width based on at least the one of the cross-chamber-blanking settings.
17. (New) A dual-chamber defibrillation or cardioversion system comprising:
dual-chamber cardioversion circuitry including first and second leads for sensing signals from respective first and second chambers of a heart and a monitoring circuit for monitoring signals sensed at the first and second leads, the monitoring circuit having:
a memory circuit for storing one or more cross-chamber-blanking settings;
and
a cross-chamber-blanking module for disabling sensing signals at either the first or second lead for a preset time period based on at least one of the cross-chamber-blanking settings; and
a programmer for changing one or more of the cross-chamber-blanking settings after implantation of the cardioversion circuitry.
18. (New) The system of claim 17, wherein the cardioversion circuitry comprises means, responsive to the monitoring circuit, for initiating a therapeutic action.
19. (New) The system of claim 17, wherein the cross-chamber-blanking module comprises means for disabling sensing signals at either the first or second lead for a preset time period based on at least one of the cross-chamber-blanking settings.

-
20. (New) The system of claim 17, wherein the cross-chamber-blanking module includes means for computing a noise window width based on a refractory period and one of the cross-chamber-blanking settings.
21. (New) The system of claim 17, wherein the cross-chamber-blanking module includes means for computing a noise window width based on at least the one of the cross-chamber-blanking settings.
22. (New) A dual-chamber defibrillation or cardioversion system comprising:
dual-chamber cardioversion circuitry including first and second leads for sensing signals from respective first and second chambers of a heart; and
a cross-chamber-blanking module for disabling sensing signals at either the first or second lead for a preset time period based on at least one programmable cross-chamber-blanking setting.
23. (New) The system of claim 22, further comprising:
a programmer for changing the one cross-chamber-blanking setting after implantation of the cardioversion circuitry.
